SUMMARY

Backend developer with 3 years of experience specializing in Python, FastAPI, and Django REST Framework, with practical experience designing REST APIs, relational database schemas, and data pipelines. Skilled in integrating ML models (PyTorch, scikit-learn) into backend services and building resilient, production-style systems with PostgreSQL and MySQL. Comfortable across the stack from API design to data persistence, with growing experience in cloud deployment (AWS, Docker, Render).

KEY SKILLS

- **Backend:** Python, FastAPI, Django, Django REST Framework, SQLAlchemy, Pydantic, Alembic
- **Databases:** PostgreSQL, MySQL, SQLite
- **Data & ML:** Scrapy, PyTorch, scikit-learn, Pandas, Matplotlib, Numpy
- **Tools:** Git, Linux, Figma

PROJECTS

Fiesta Gastro Cafe - Multi-language Restaurant Website - fiestagastro.dev -
Python · Django · Django REST Framework · PostgreSQL · REST API

Backend and REST API for a restaurant website supporting 3 languages (RO/EN/RU).

- Built an admin-managed CMS with DRF - staff update content in under 30 seconds, no developer needed
- Designed a reusable content architecture supporting 3+ section types, enabling new pages without backend changes
- Implemented automatic multi-language (RO/EN/RU) switching via REST API
- Covered core functionality with automated pytest tests
- Cut long-term maintenance costs by an estimated 70-100% via a low-cost, easily trained admin model

---

VM.AI - AI-Powered Personal Scheduling System
Python · FastAPI · PostgreSQL · SQLAlchemy · ML Integration

Open-source AI scheduling system that converts natural language and images into personalized, behavior-aware daily schedules - designed to cut manual scheduling time significantly.

- Integrated 4 ML models (NLP parsing, image classification, task matching, duration prediction) into one backend pipeline using Python, PyTorch, and scikit-learn
- Built a behavior-learning system that personalizes scheduling to each user's habits and preferences over time
- Built a stable scheduling algorithm that automates task placement, reducing manual scheduling time by up to 4 hours/week
- Designed the PostgreSQL database schema and a RESTful 15-endpoint API layer with FastAPI and SQLAlchemy

---

BookStoreScraper - Web Scraping & Data Pipeline **Python · Scrapy · MySQL**

Scraper for a online bookstore, extracting book listings and store locations into a structured database.

- Built a Scrapy scraper extracting book listings and store data into MySQL
- Built a two-stage pipeline cleaning, validating, and upserting scraped data
- Added anti-bot resilience via rotating headers and proxy fallback
- Designed a relational schema linking books to multi-location availability
